- **Financial Services (Chartered accountants, Loaning institutions, Micro Finance)**
- **Banks**
- **Data warehouse and analytics**
- **Data Scientists**

- **Tours & Travel**
- **Recruitment Companies**
- **Software Development, Product and services companies.**

The Problem

Today companies have no time and we need specific answers. To get resources, is difficult. Available resources do not satisfy requirements and have little or no experience. In this scenario, people need quick turn around time and have little money. RiverLog to the rescue. With a nominal fee, RiverLog's staff can be online or make direct contact and talk to you about your problems. Most often we will present you with a video or an audio addressing your problem. Here below is a case study:-

Case I

A telecommunication company had purchased several software components from a software company. Their staff visits the premises on a day to day bases. Monthly there is a charge that they claim for their services. Truly what they are doing is updating their software and correcting their bugs for which YOU pay.

Solution RiverLog intervened and resolved this issue. RiverLog presented a 15 minutes video on 5 different slots of 5 minutes each. The IT staff of telecommunication company called upon RiverLog in all of their meetings and thereby reducing price charged on the company by the third party. The software vendor also got benefited by RiverLog's high value technical services, that they signed up RiverLog for performance tuning and optimization of their application code.

Case II

A financial institution has installed a software designed and developed by a local software company. But, every day, the software individual who is doing the computer work was calling the software company to demonstrate a feature how it works. Because, whenever the individual tried to execute that function, it simply does nothing. Management got involved and inquired about delays in getting reports and finally figured that the vendor from whom the company has purchased the software has failed to come up with the right software. Analysis and later development was done in-appropriately.

RiverLog's one week remote assessment, interviews with stakeholders, remote view of the system and code presented RiverLog with a great deal of things and possibilities that could have been done. RiverLog presented with a analysis report and solved the problem, thereby helping companies save a great deal of money and wastage of time and untimely delivery of reports for management. Transactions now went smooth and faster.

Case III

An IATA certified huge company had asked a software company to automate with systems. But all of sudden, there were lots of printers, terminals and other accessories which were installed for which there were no use or nobody seemed to use it. Printer papers and inks became a real overhead. Reports are being done by copying it into CD's and later being taken to another system and taking a report again there by causing heavy delays. RiverLog resolved it by its integration frameworks. By involving people who are Sr. Systems analysts/Business Analysts and architects, RiverLog go to the bottom of the problem and resolved it at absolutely very low cost.
